WHO International Standard
Calcitonin, Eel
NIBSC code: 88/556
Instructions for use
(Version 3.0, Dated 18/12/2007)

1. INTENDED USE
The International Standard (IS) consists of a batch of ampoules which
was established at the 40th Meeting of the WHO Expert Committee on
Biological Standardization in 1989. Eel calcitonin has structural similarities
with salmon calcitonin and, to date, research preparations have been
evaluated with reference to the salmon calcitonin standard using the rat
hypocalcaemia assay method. However, as salmon and eel calcitonins
do have structural differences, which are likely to become evident if
different in vivo or in vitro assay methods are used, a standard for eel
calcitonin is required.

2. CAUTION
This preparation is not for administration to humans or animals in
the human food chain.

The preparation contains material of human origin, which has been
tested and found negative for HBsAg, HIV antibody and HCV RNA by
PCR.

As with all materials of biological origin, this preparation should be
regarded as potentially hazardous to health. It should be used and
discarded according to your own laboratory’s safety procedures. Such
safety procedures probably will include the wearing of protective
gloves and avoiding the generation of aerosols. Care should be
exercised in opening ampoules or vials, to avoid cuts.

3. UNITAGE
Each ampoule of the IS contains 88 International Units (by definition).

4. CONTENTS
Each ampoule contains the residue after freeze-drying of 0.5ml of a
solution which contained:-

- Synthetic eel calcitonin approximately 20µg
- Albumin (human) approximately 500µg
- Mannitol approximately 5mg

And pure dry nitrogen at slightly less than atmospheric pressure.

5. STORAGE
Unopened ampoules should be stored at -20°C.

Please note: because of the inherent stability of lyophilized material, NIBSC may ship these materials at ambient temperature.

6. DIRECTIONS FOR OPENING
Tap the ampoule gently to collect the material at the bottom (labelled)
end. Ensure ampoule is scored all round at the narrow part of the
neck, with a diamond or tungsten carbide tipped glass knife file or
other suitable implement before attempting to open. Place the
ampoule in the ampoule opener, positioning the score at position ‘A’;
shown in the diagram below. Surround the ampoule with cloth or
layers of tissue paper. Grip the ampoule and holder in the hand and
squeeze at point ‘B’. The ampoule will snap open. Take care to avoid
cuts and projectile glass fragments that enter eyes. Take care that no
material is lost from the ampoule and that no glass falls into the
ampoule.

7. USE OF MATERIAL
For all practical purposes, each ampoule of the IS contains the same
quantity of the substances listed. Dissolve the total contents of the
ampoule in a known volume of a suitable solvent (buffer at pH 3.5) with
carrier protein where extensive dilution is required. No attempt should be
made to weigh out any portion of the freeze-dried material.

For economy of use, it is recommended that the solution be sub-divided
into several small containers, frozen rapidly e.g. in dry ice and stored at -
40°C or below. Careful evaluation will be needed to determine a feasible
time of storage.

The ampoules do not contain bacteriostat and solutions of the IS should
not be assumed to be sterile.

8. PREPARATION OF AMPOULES
Eel calcitonin manufactured by Bachem, USA, batch P1026 was
generously donated to WHO for ampouling by Dr F. Lattanzi and Dr R.
Vanni, Sclavo SpA, Siena, Italy. Analytical data provided by Sclavo stated
that the peptide was >97% monocomponent and that the powder contained 5.56% moisture, 4.16% acetic acid and had a biological potency of 5061 units/mg in terms of the first International Reference Preparation of salmon calcitonin, ampoule code 72/158.

The filling conditions, and particularly the need to add albumin, were
based on trial fills and stability evaluations carried out between 1982 and
1985. A research standard for eCT, ampoule code 84/587, had been
prepared and included in the international collaborative study for the first
International Standard of the ASU17 analogue of eCT (Unpublished report
WHO/BS/85.1494).

The eel calcitonin was ampouled in July 1998. The peptide was dissolved
in 0.001M acetic acid with 1% mannitol and 0.1% albumin and distributed
into approximately 2,000 ampoules coded 88/556. Mean weight of filling
solution was 0.50733, coefficient of variation 0.2316 (n=32).

After freeze-drying, ampoules were filled with pre dry nitrogen, sealed
by glass fusion, tested for leaks and stored at -20°C in the dark. The
ampouling was carried out according to procedures recommended by the
WHO Expert Committee on Biological Standardisation (ECBS) (annex 4,
29th ECBS, 1978).

9. COLLABORATIVE STUDY
Seventeen laboratories in 10 countries took part in an international
collaborative study. Each participant was asked to carry out at least two
independent assays (i.e. using freshly reconstituted ampoules). As far as
practicable each assay was to include the IRP sCT code 72/286 as
calibrator, and the proposed International Standard eCT 88/556, each at 3
doses, with a minimum of 6 rats/dose in a single assay (or replicate wells
for in vitro methods), so that assumptions of linearity and parallelism
could be examined. Raw assay data from in vivo bioassays in 16
laboratories and in vitro bioassays in one laboratory were returned to
NIBSC for centralized statistical analysis.

The statistical and computing methods used are based on those
described in references 1-3. The proposed replacement International
Standard for salmon calcitonin ampoule code 87/788 was included and
calibrated in this study.

With the exception of one laboratory (for in vitro bioassays), all
laboratories carried out the in vivo rat hypocalcaemia bioassay, usually
according to the procedure described in the relevant pharmacopoeia
although there were minor differences in the rat hypocalcaemia
methodology reported by the 16 laboratories.

The in vitro bioassay carried out by one laboratory was based on the
accumulation of cAMP by a breast cancer cell line known to have
receptors for calcitonins (4).

The laboratory mean estimates for eCT, 88/556, in terms of the first IRP
sCT, by in vivo bioassay were homogeneous with a weighted mean of 88
units per ampoule (95% confidence limits 85-91) if the mean estimate for
one laboratory was excluded.

Page 1 of 3
Estimates were also examined for any trends relating to in vivo bioassay details such as strain of rat, route of injection, etc. No consistent trends clearly attributable to methodology were detected. It is interesting to note that the in vitro bioassay appears to show a discrimination between eel and salmon calcitonins.

10. STABILITY

It is the policy of WHO not to assign an expiry date to their international reference materials. They remain valid with the assigned potency and status until withdrawn or amended.

The qualitative and quantitative analysis of 20µg peptide in the presence of an excess of albumin (500µg) is not readily carried out by HPLC. Accelerated degradation samples of eCT were therefore examined in two independent in vivo bioassays by one laboratory. Resulting estimates of potency relative to samples of eCT stored continuously at -20°C were: for samples stored for 9 months at +20°C, 0.89 (95% confidence limits 0.75-1.06) and for samples stored for 9 months at +45°C (95% confidence limits 0.73-1.03). Estimates for samples stored at these two temperatures were similar with neither differing significantly from a relative potency of 1 so that no rate of degradation could be predicted. These data indicate that eCT 88/556 is sufficiently stable to serve as a standard.

11. REFERENCES

12. ACKNOWLEDGEMENTS

Grateful acknowledgements are due to Dr. F. Lattanzi and Dr R. Vanni, Sclavo SpA, Siena, Italy for donating the peptide, to the staff of the Standards Processing Division of NIBSC for ampouling and to all the participants in the study.

13. FURTHER INFORMATION

14. CUSTOMER FEEDBACK

Customers are encouraged to provide feedback on the suitability or use of the material provided or other aspects of our service. Please send any comments to enquiries@nibsc.org

15. CITATION

In all publications, including data sheets, in which this material is referenced, it is important that the preparation's title, its status, the NIBSC code number, and the name and address of NIBSC are cited and cited correctly.

16. MATERIAL SAFETY SHEET

Classification in accordance with Directive 2000/54/EC, Regulation (EC) No 1272/2008: Not applicable or not classified

<table>

Toxicological properties

Effects of inhalation: Not established, avoid inhalation
Effects of ingestion: Not established, avoid ingestion
Effects of skin absorption: Not established, avoid contact with skin

Suggested First Aid

Inhalation: Seek medical advice
Ingestion: Seek medical advice
Contact with eyes: Wash with copious amounts of water. Seek medical advice
Contact with skin: Wash thoroughly with water.

Action on Spillage and Method of Disposal

Spillage of ampoule contents should be taken up with absorbent material wetted with an appropriate disinfectant. Rinse area with an appropriate disinfectant followed by water. Absorbent materials used to treat spillage should be treated as biological waste.

17. LIABILITY AND LOSS

In the event that this document is translated into another language, the English language version shall prevail in the event of any inconsistencies between the documents.

Unless expressly stated otherwise by NIBSC, NIBSC’s Standard Terms and Conditions for the Supply of Materials (available at http://www.nibsc.org/About_Us/Terms_and_Conditions.aspx or upon request by the Recipient) (“Conditions”) apply to the exclusion of all other terms and are hereby incorporated into this document by reference. The Recipient’s attention is drawn in particular to the provisions of clause 11 of the Conditions.

17. CERTIFICATE OF ANALYSIS

NIBSC does not provide a Certificate of Analysis for WHO Biological Reference Materials because they are internationally recognised primary reference materials fully described in the instructions for use. The reference materials are established according to the WHO Recommendations for the preparation, characterization and establishment of international and other biological reference standards [http://www.who.int/bloodproducts/publications/TRS922Annex2_Inter_biolefsstandardsrev2004.pdf](http://www.who.int/bloodproducts/publications/TRS922Annex2_Inter_biolefsstandardsrev2004.pdf) (revised 2004). They are officially endorsed by the WHO Expert Committee on Biological Standardization (ECBS) based on the report of the international collaborative study which established their suitability for the intended use.
